

## VERSION 01.03.07

### - Two shortcuts to make editing faster:

We added new buttons to the Pantograph Offset functions. With these you can set the most popular offset values in one step.

There is a rotation step button now in Modify Pattern and Modify Block. Repeated touches of this button will browse through the rotation step values of 1°, 5°, 30°, 45°, 72° (for five-point stars or pentagonal blocks) or 90°. This angle will be used when you touch the rotate buttons, but 1° resolution is used when you rotate the pattern or block by dragging it on the screen.

- **Moving multiple patterns between catalogs:** If you touch the [Move] button without selecting a pattern in a catalog, the whole content of the catalog will be marked for moving. The computer will ask for a destination catalog, which can be an existing one, or you can create a new one. All the patterns from the source catalog will be moved to the destination catalog. This feature is convenient when you load patterns purchased from a designer using the Load Patterns function, which puts the patterns in the "downloads" directory. With the batch-moving feature you can move all the patterns from "downloads" to the designer's own catalog.

### - Two improvements in Sew Quilt mode:

We improved the clipping feature, so now there is only one straight sewing line substituting the clipped-off portions of the patterns.

When stopping to cut threads is selected, the machine will not do backstitching at the end of the pattern. This can help when, due to shrinkage, the end point of a block pattern does not match the start point. When the machine stops, you can start the stitching manually and fill the gap before securing and cutting the threads.

- **Password protection in Export Pattern mode:** Patterns with embedded password - even if it is your own - will be blocked, so you cannot export them.

- **Debugging:** It was reported that it was impossible to turn the warning beep on/off. We found and fixed this bug, but we recommend keeping the warning beep on, so you can leave the machine alone until it asks for attention...

All relevant help screens were updated with the new features.
